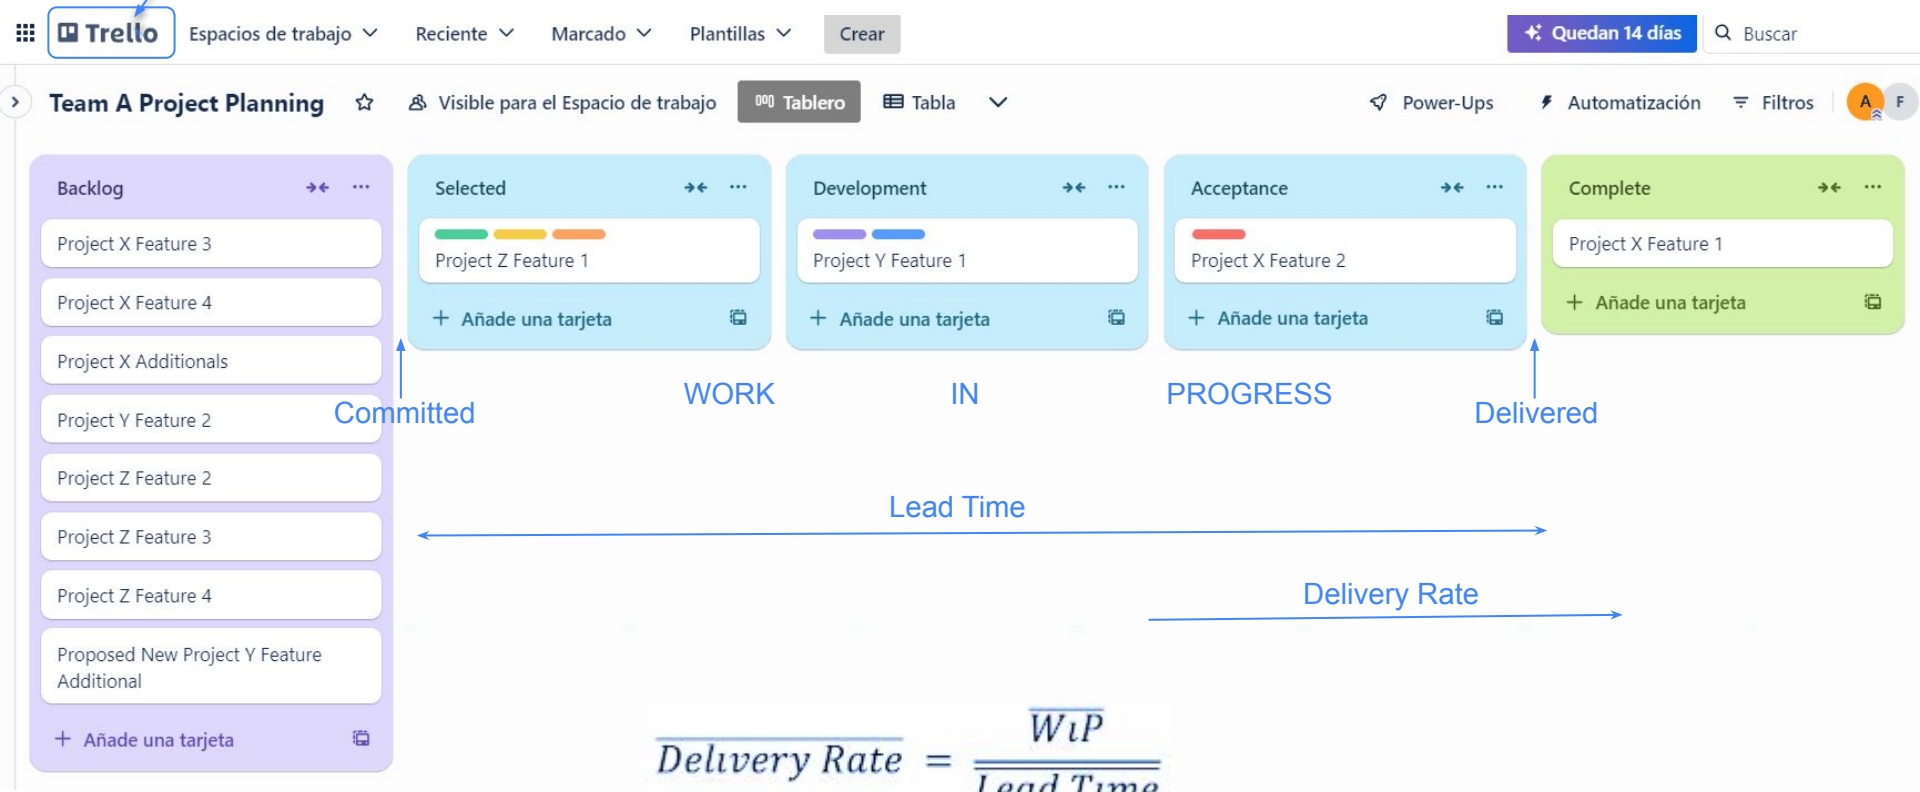
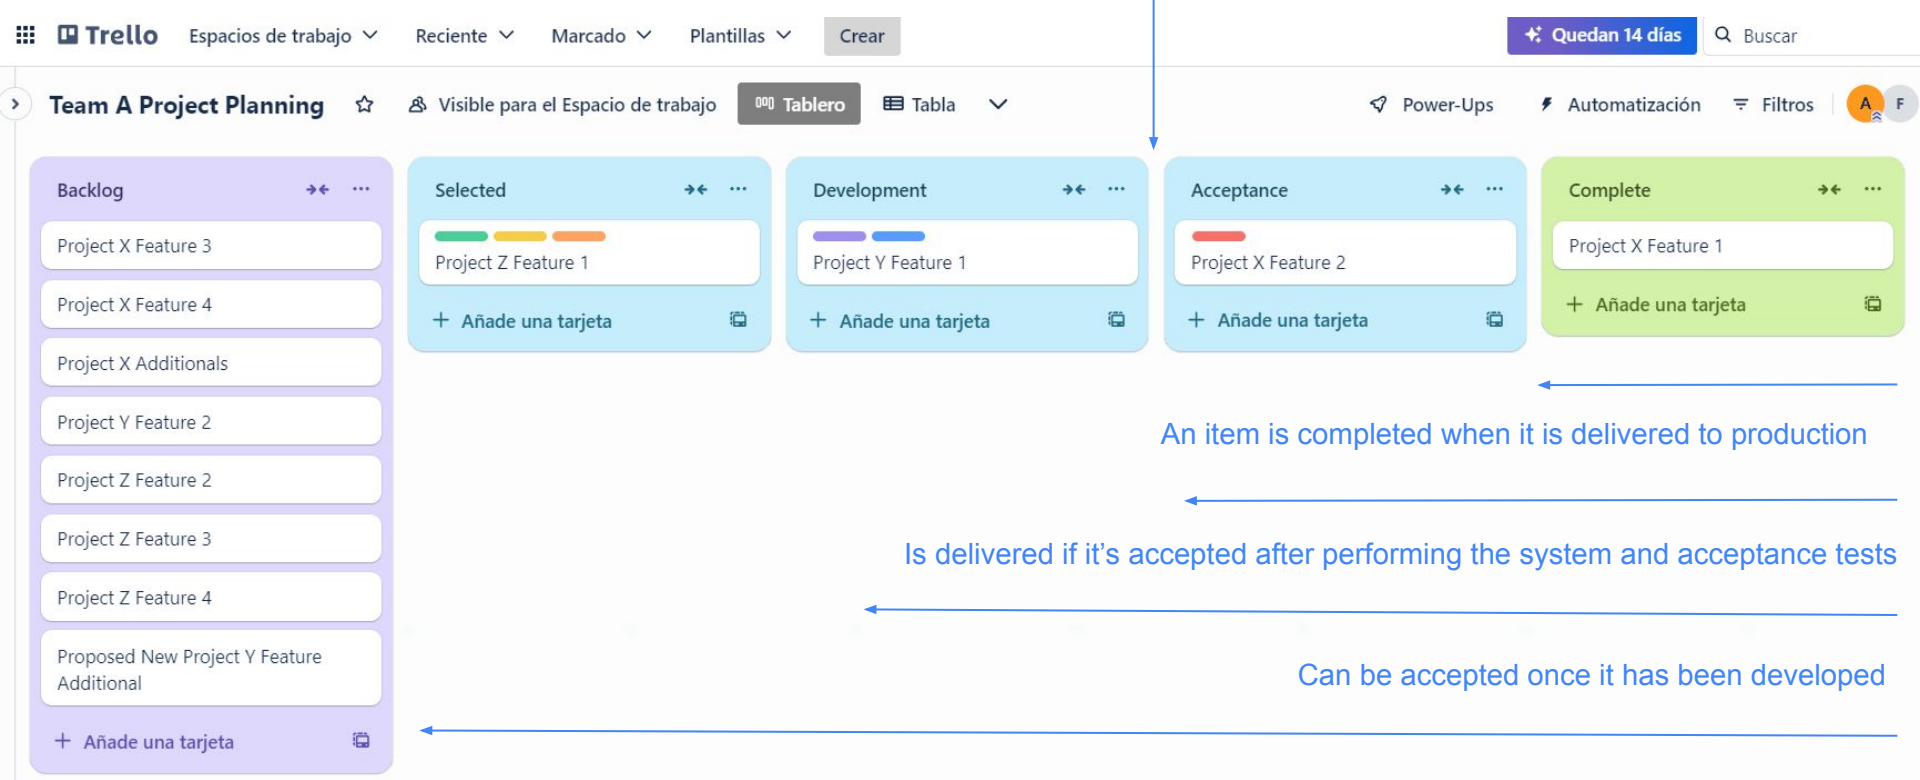
Team is using Trello, a Kanban system tool for organizing projects



$$\overline{Delivery\ Rate} = \frac{\overline{WiP}}{\overline{Lead\ Time}}$$

Members will organize themselves to optimize the Lead Time by limiting the Work in Progress

Input of what has to be Accepted is the Output of what has been Developed



An item is completed when it is delivered to production

Is delivered if it's accepted after performing the system and acceptance tests

Can be accepted once it has been developed

Starts to be developed after is selected in the decision of which next feature is pulled from backlog

A new proposed feature came up during the process.
Instead of recalculating all the organization monthly
as in traditional approach,
it will remain in backlog until it's selected
